Patient-Reported Outcomes and Oral Health in Patients with Vasculitis Study (PRO-TOOTH-VASC)

Help us learn more about oral health in patients with vasculitis

Oral health is often overlooked in people with vasculitis. Some forms of vasculitis can affect the mouth, causing symptoms like sore gums, mouth sores, or swelling of the salivary glands. Medications used to treat vasculitis may also increase the risk of mouth infections, cavities, or other dental problems.

Join the PRO-TOOTH-VASC study today! By sharing your experiences, you can help researchers learn more about oral symptoms, quality of life, and how medications may influence oral health in patients living with vasculitis.

100% Online

Advance research at the convenience of your home

10-20 Minutes

PRO-TOOTH-VASC is a one-time, online questionnaire

Impact Others

Make a difference in the vasculitis community

Dr. Christian Pagnoux
Co-Principal Investigator

"Some of our patients with vasculitis have experienced serious dental problems, which raised important questions. When we looked for research on oral and dental health in vasculitis, we found that very little information exists. This study was created to help fill that gap.

Please consider participating in the PRO-TOOTH-VASC study. Your participation in this study may help guide future research and improve care for people living with vasculitis."
